

Waste Tyre Recycling Plants

Today, the ever increasing usage of rubber tyres is leading to exponential generation of hazardous waste. This is no-longer restricted to specific industrial usages (mines, ports, power plants) but has severe effects on urban lives (private & commercial tyres) as well. A key strategy to control this environmental menace is to recover and recycle condemned rubber tyres by commissioning suitable disposal systems.

TranzTel Technologies India is equipped with proven Czech technology to design & engineer, manufacture and commission efficient condemned rubber tyre recycling plants to partly help in managing disposal of these wastes and put the salvaged parts into further good use.
